Note: Do this exercise in the exercises folder/repository you have made earlier!

Create a capitalization3.html and capitalization3.js - there need only be output to the console!

3caPitalization

Given a single name string in an unknown case, e.g. "peter" or "PETER" - create a new string with the same name, where the **third** letter is uppercase, and the rest is lowercase. I.e. "peTer".

Hint: use `substring`, `toUpperCase`, `toLowerCase` and simple string concatenation

Test your code with various crazy combinations of your own name, like "pETer", "PEter", "peteR", "PEtER" and so on.

Make sure that it also works with longer names. Don't worry about names shorter than 3 characters.

Important: DO NOT look for solutions online - use the MDN documentation, and find the string methods that will help you. This exercise is about solving an unknown problem, not about finding existing solutions.

When complete, add, commit, and also paste the js-code here below.
